FilterBank HD v6

概要描述

可重现任何模拟均衡器音色

描述

FilterBank, McDSP's first product, is an equalizer plug-in that rivals any analog EQ with its flexible design and substantial feature collection. FilterBank can emulate any EQ, or be used to create a distinct custom EQ. FilterBank is three plug-ins:

E606 – parametric, high and low shelving EQ, high and low pass filters

F202 – steep high and low pass filtering with resonant Q control

P606 – parametric EQ with variable Q modes

Since its debut in 1998, FilterBank has become a legend within the audio community. With its unique Peak, Slope, Dip controls and variable Q modes FilterBank can emulate any EQ, or be used to create a distinct custom EQ. For more information, check out the Colin's Corner article about this product.
